

Supplying The Dutch Media Industry with Zero Emissions

Future transitions towards zero emissions transporation within the Dutch media supplying sector in Amsterdam

1. Overview

Figure 1. Film equipment mounted on a vehicle^[1]

- ✓ The Dutch media industry, encompassing film, television, and advertising, faces a transition to zero-emission fleets by 2030 to comply with Amsterdam's regulations^[2].
- ✓ Suppliers in the BFF union encounter financial, logistical, and infrastructural challenges in this shift.

4. Methodology

5. Results & Discussion

Data processing

- 9 BFF members participated in the survey (50% of all members).
- All vehicles are integrated into a single consolidated fleet.
- In the fleet, 54% of the vehicles are newly purchased, while 46% are used vehicles.

Fleet Composition-SQ1

Figure 3. Fleet composition by vehicle type

Annual Distance

1.2M km (6.5% in zero-emission zones)

Figure 4. Share of euro standard in the total fleet

Challenges Identified-SQ2

Financial
High upfront costs (€28K- €330K EVs).

Regulatory
Exemptions per vehicle (€250/application), inflexible policies.

Technical
Limited EV range (350 km), slow charging (5–20 hours), load capacity.

Projections and Recommendations-SQ3

Figure 5. Total carbon emissions from total fleet distances travelled in zero-emission zones under the three scenarios (t CO₂)

Figure 6. Total costs and total final energy consumption costs (fuel/electricity) under the three scenarios (m€)

- Policy:** Distance-based exemptions, phased transition aligned with vehicle lifespans, provide targeted support to sectors with specialised vehicle requirements and small companies.
- Industry:** BFF collective negotiation for subsidies and exemptions for a gradual transition to allow time for a wider and more affordable EV market. Co-investment in charging infrastructure.
- Infrastructure:** Collaboration with the energy sector to address grid congestion.

6. Conclusions

- ✓ **SQ1:** Current fleet composition.
- ✓ **SQ2:** Different perspectives and perceived barriers.
- ✓ **SQ3:** Possible transition scenarios.
- ✓ The transition requires coordinated efforts: tailored policies, financial support, and infrastructure upgrades.
- ✓ While EVs are the primary pathway, exemptions and gradual compliance are critical for feasibility.
- ✓ Future research should explore company-specific analyses.
